

Cumulative Wild Yearling Chinook and Steelhead PIT-tag Detections (through April 20, 2026)

Caveats:

- These are NOT population estimates.
 - These are simply raw cumulative PIT-tag detection counts of wild yearling Chinook and wild steelhead at Lower Granite Dam (GRJ and GRS) and McNary Dam (MCJ) in 2026 compared to the current 5-year average (2021-2025).
- For Lower Granite detections, PIT-tagged fish had to be released at or above Lower Granite.
- For McNary detections, PIT-tagged fish were released above McNary Dam and broken into Zone of release:
 - MCOL – released into tributaries between McNary and Priest Rapids dams (e.g., Yakima, Walla Walla, etc.)
 - UCOL – released above Priest Rapids Dam
 - SNAKE – released into Snake River, above the confluence
- FPC attempted to filter out fish tagged as adults and potential adult/kelt detections
- In 2026, the GRS detection system at Lower Granite became operational on March 1st but on an intermittent basis (~4 hours per day, ~3 days per week) until 24-hour (7-days per week) RSW spill began on March 21st. The GRJ detection system started on March 12th.
- In 2026, the MCJ detection system at McNary became operational on March 30th.

Lower Granite Detections

Figure 1. Cumulative PIT-tag detections at Lower Granite Dam in 2026 (red dots) versus current 5-year average (2021-2025). 2026 detections are through April 20, 2026.

Table 1. Total detections of PIT-tagged wild Snake River yearling Chinook and steelhead at Lower Granite Dam, by sub-basin, release site, and species (through April 20, 2026)

| Sub-basin | Release Site | Chinook | Steelhead | Total |
|-----------------|----------------|---------|-----------|-------|
